# MULTIROLL MARK SERIES ROLLER SKIDS

## Machinery Moving Dependability for Over 50 Years

The Mark Series Roller Skids were designed to help you move your heavy equipment or machinery, as easily and affordable as possible. Available in several styles and wheel types, the Mark Series is available in a configuration to fit your every need.

### TYPES

The Mark series is produced in six basic models, with each unit's capacity dependent upon size and wheel type. The Mark 1 has one roller and is light and compact for easier transport. The Mark 2 offers 2 rollers for greater stability. The Mark 3 features 3 rollers to bear heavier loads. The Mark 4 & 5 are equipped with steel roller chains instead of rollers, to move extremely heavy loads. In contrast, the Mark 6 is fitted with six polyurethane or steel rollers for a smoother ride, while still capable of handling fairly heavy loads.

### ROLLERS

The Mark Series offers several different roller materials to suit all application types. The Mark 1, 2, 3 and 6 are available with nylon, polyurethane or steel rollers depending upon desired capacity. Each roller uses two shielded bearings to prevent failure and prolong service life. The Mark 4 & 5 models feature continuous steel chain rollers. A Mark 4 has 12 rollers, while the wider framed Mark 5 has 14 rollers for a more favorable distribution of weight.

### ROLLER TOP PLATES

Each type of Mark roller skid is available with 3 different spiked top surfaces to best fit your individual application. The Straight Top is a flat, non-movable surface. The Swivel Top allows the rollers to be turned in a different direction while in motion. The Swivel-Lock Top permits the roller to be turned only while depressing a release catch.

*\*Swivel-Lock version only available on the Mark 4, 5 and 6.*

### CAPACITY

Our wide selection of model types allows for a limitless range of capacities for all applications. Single unit capacities range from 1.25 tons on the Mark 1, to 15 tons on the Mark 5. Combined capacities (4-individual skids evenly distributed under a load) range from 5 to 60 tons.

### OPTIONAL ACCESORIES

Optional accessories include a T-Bar handle for increased pushing leverage, tandem connectors that connect two skids together for increased capacity & stability and rubber pads to protect sensitive loads from damage.
